

Three directions for the Mensfe forum

Each direction redesigns the same forum around the same content: a forum-first homepage, the board index, a topic page and a medical information page, all mobile-ready and built to fix the issues in the SEO audit. They differ in personality. Please pick one direction (or the parts you like from each) and we will develop it into the full site and SMF theme.

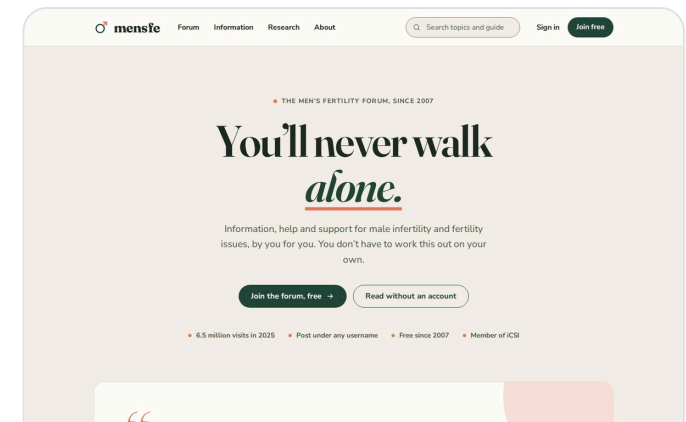

A • Harbour

Bold and branded. Confident, recognisable, a little dramatic.

B • Clear

Clean and clinical. Feels like a modern health service crossed with a forum app.

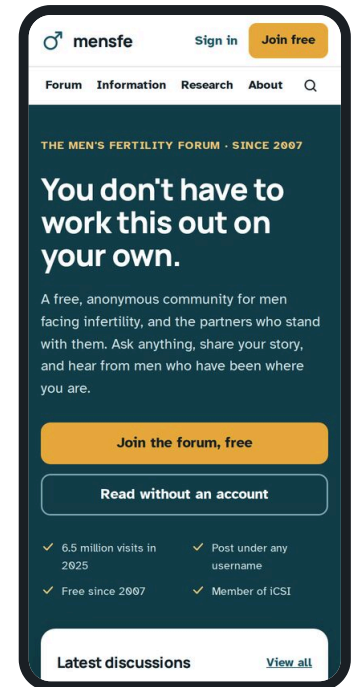

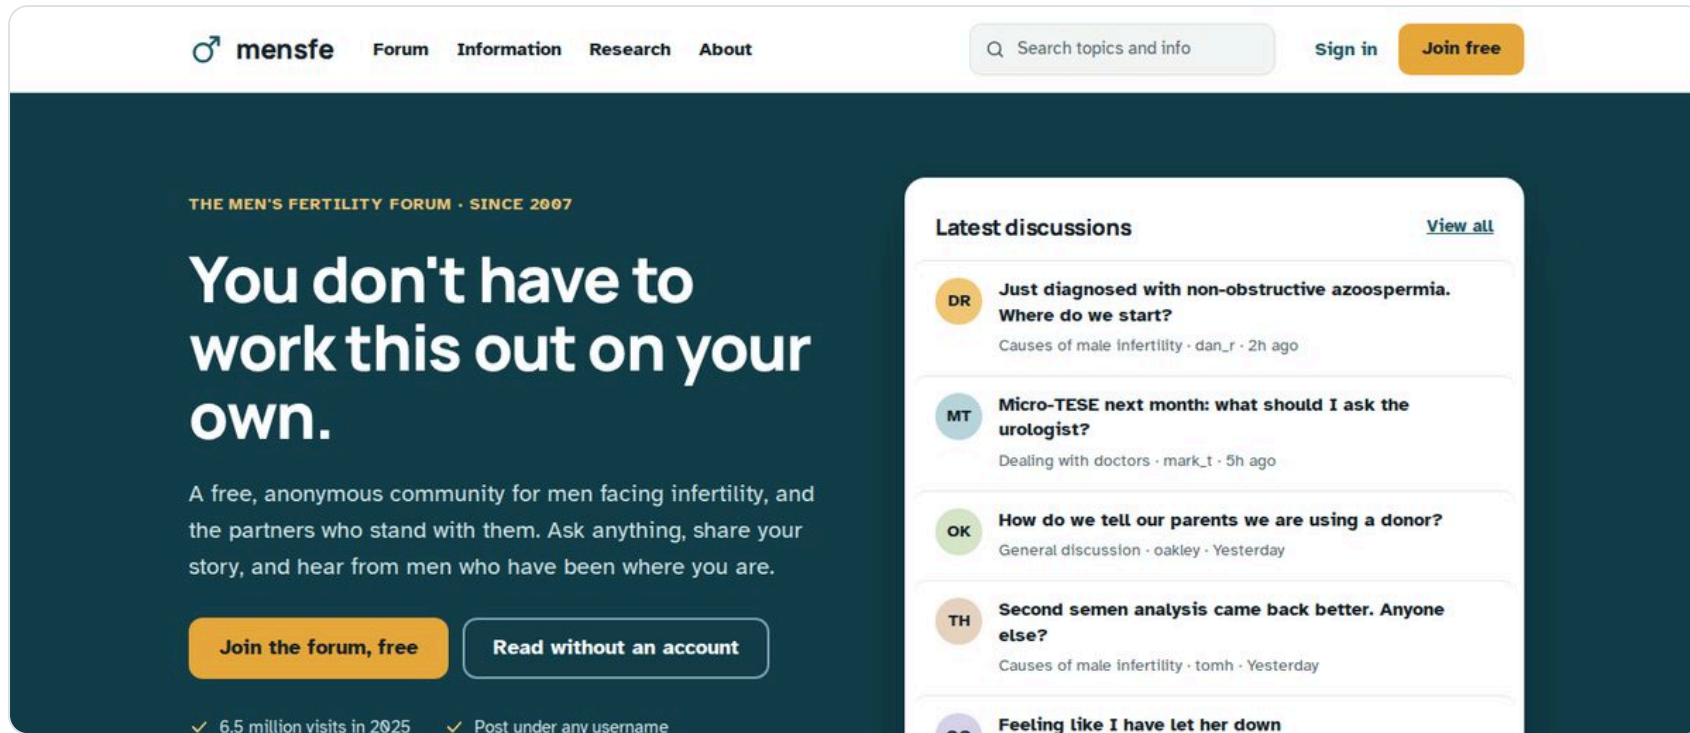

C • Stories

Warm and human. Leads with members' voices, like a thoughtful magazine.

All three share the same fixes: one clear heading per page, real text instead of text in images, latest discussions on the homepage, the founders' credentials on show, reviewer and date on medical pages, accessible contrast, and layouts that work on phones. Member counts appear as [n] placeholders, and sample posts are illustrative.

Harbour: bold and branded

Personality

- The deep sea-teal of the current shoreline banner, with a sunset-gold call to action
- A strong, memorable hero; the forum is visible from the first screen
- Best if Mensfe wants to look established and confident

Colour and type

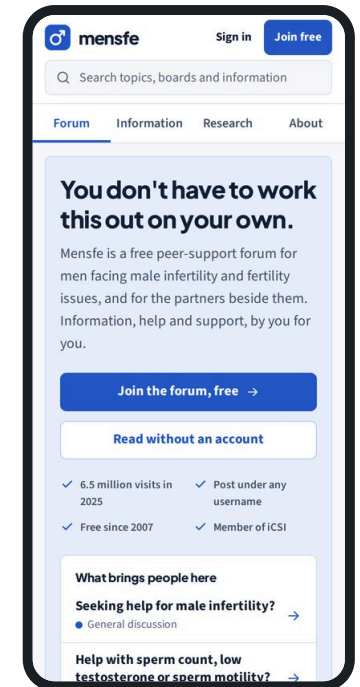

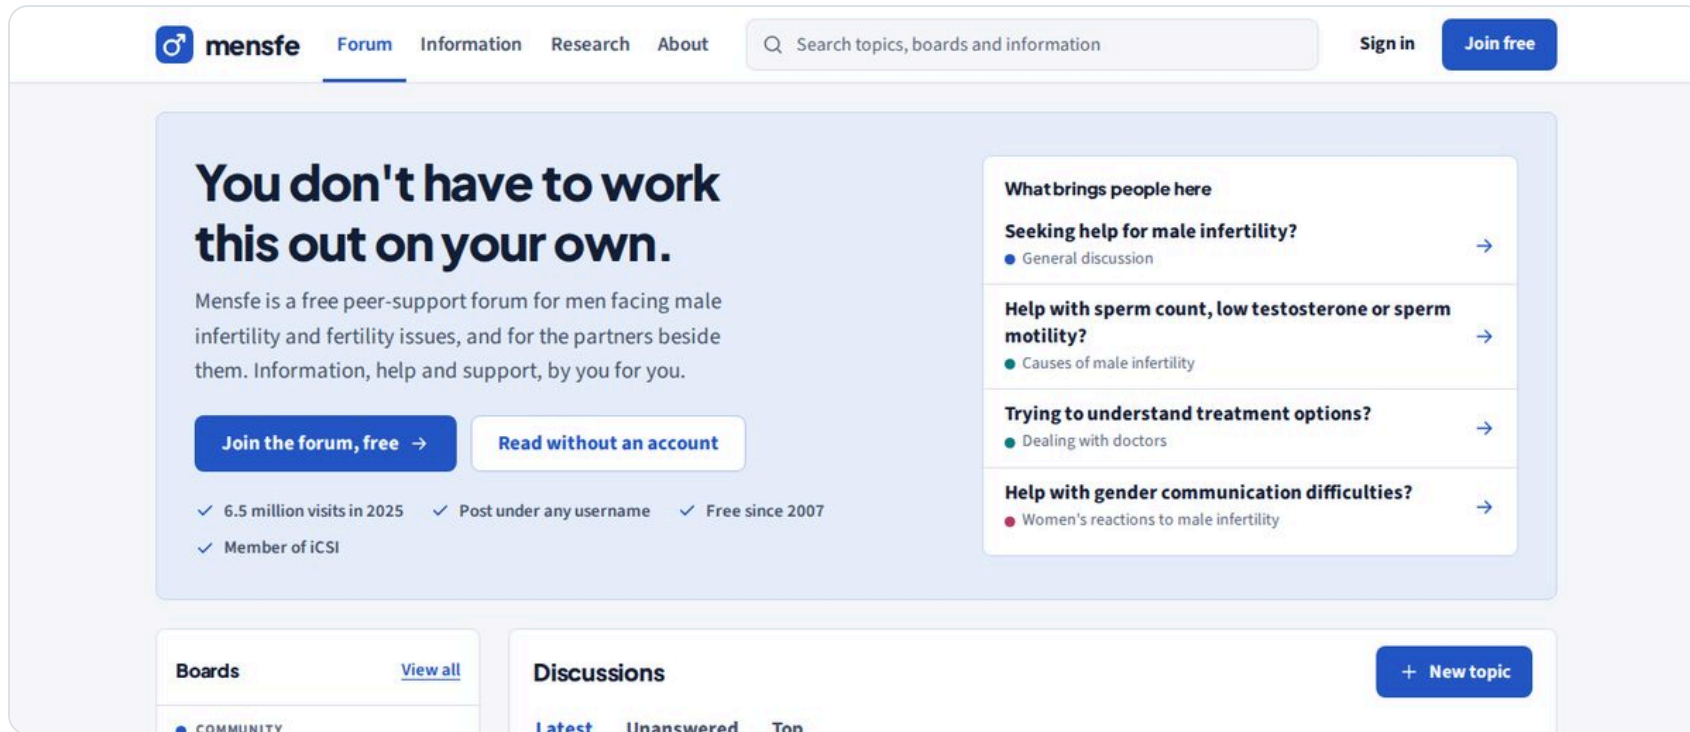

- Manrope headings, Atkinson Hyperlegible body text (designed for low-vision readability)

Watch-outs

- Dark bands are heavier on long pages
- Gold needs disciplined use to stay special

Clear: clean and clinical

Personality

- Calm, trustworthy and information-dense, like a modern health service
- A forum "app" layout: boards in a sidebar, a live topic feed with Latest, Unanswered and Top
- Best if Mensfe wants to feel medically credible and efficient

Colour and type

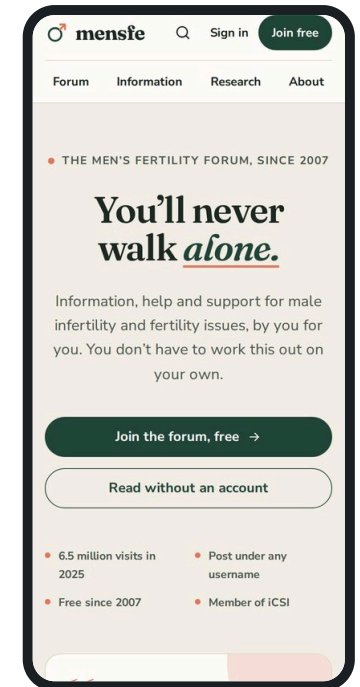

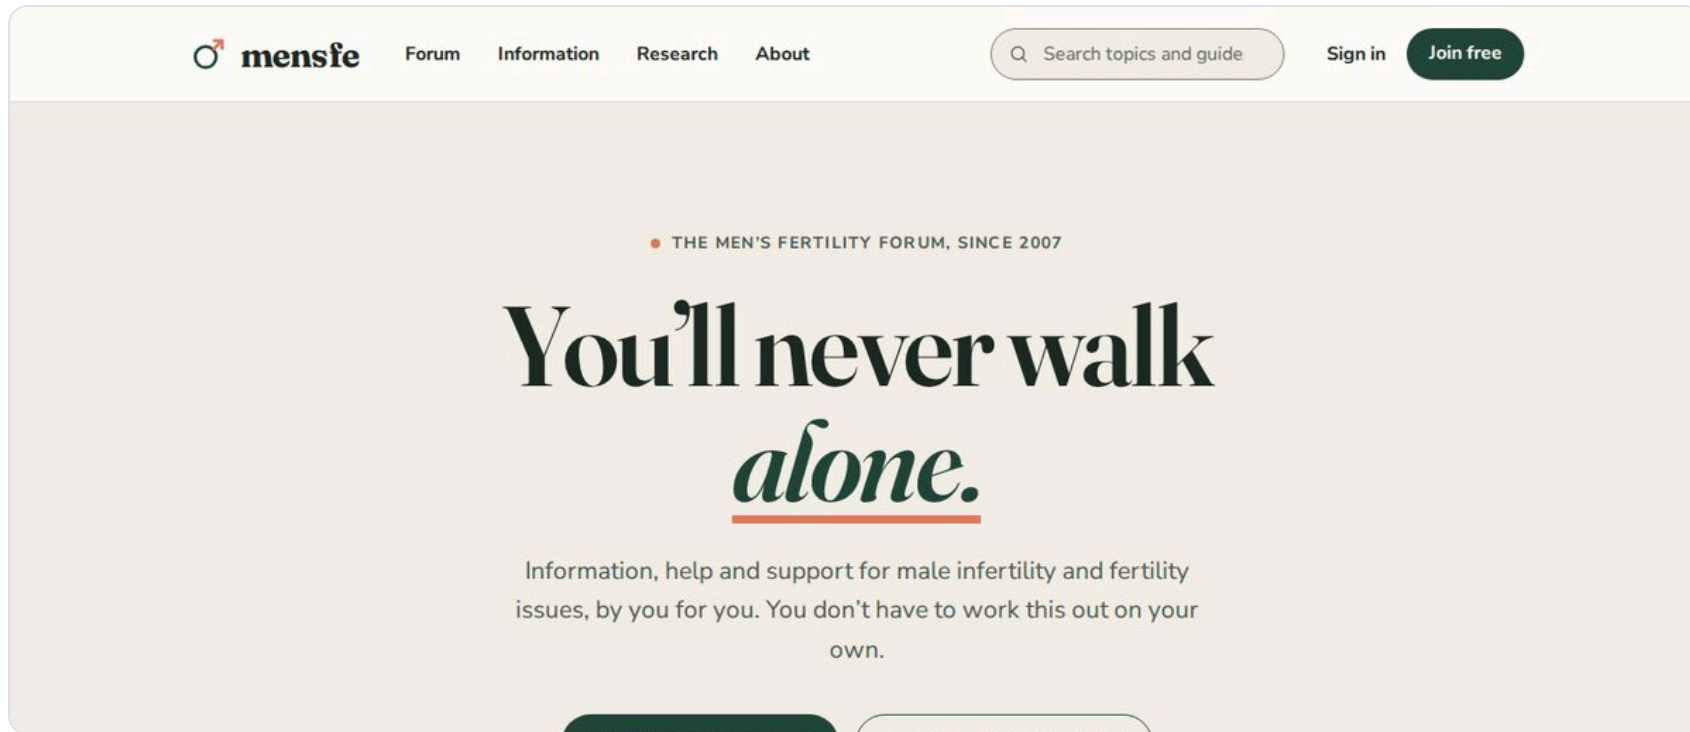

- Plus Jakarta Sans headings, Source Sans 3 body text

Watch-outs

- Can feel less personal; relies on activity in the feed
- Closest to SMF's own structure, so the easiest to theme

Stories: warm and human

Personality

- Editorial and reassuring; members' own words take centre stage
- Generous spacing and a serif voice for a reflective, magazine feel
- Best if Mensfe wants to emphasise empathy and the emotional side

Colour and type

- Fraunces headings, Nunito Sans body text

Watch-outs

- Needs members' consent for featured stories
- Less dense, so more scrolling on busy boards

How the directions compare

	A · HARBOUR	B · CLEAR	C · STORIES
First impression	Confident, branded	Professional, efficient	Warm, empathetic
Forum emphasis	Latest-discussions card in the hero; board grid	Live topic feed is the homepage	Featured member stories, then boards
Medical credibility	Good	Strongest	Good, more personal
Emotional warmth	Medium	Lower	Highest
Effort to theme SMF	Medium	Lowest	Medium–high
Accessibility	Very high (hyperlegible body font)	High	High

What happens next: once a direction is chosen, we design the remaining pages (sign-up, profile, search, private messages and the 12 information guides), build the responsive SMF theme, and implement the SEO and AI visibility fixes from the audits during the same build.

My wife and I got the results last week. Two semen analyses, both showed no sperm at all, and the consultant thinks it is probably non-obstructive. My FSH came back high.

I honestly don't know what to feel. I keep reading about micro-TESE and success rates and it is all a blur. If anyone has been through this, what should we be asking at the next appointment?

I was exactly where you are three years ago. Write your questions down before the appointment, because you will forget them in the room. Ask whether they have checked your karyotype and for Y-chromosome microdeletions, because that changed what our options were.

And look after yourself. The first month was the hardest part for me.

Welcome, and thank you for posting. A lot of men read this board without ever writing, so this will help others too. Our [Azoospermia guide](#) explains the tests and treatment terms you will hear, and the [Counselling Support](#) page lists services if you would like to talk to someone.

Wife of a member here. It is not your fault, and she is probably as worried about you as about the result. Talking to each other helped us more than anything the clinic said.

Azoospermia

What it means when a semen analysis finds no sperm, the two main types, how it is diagnosed and the treatment routes to parenthood.

 Written by **[Author name]**  Medically reviewed by **[Reviewer name, credentials]**  Last reviewed **[date]**

Mensfe is run by **Pip Reilly**, a professional fertility counsellor, and **Rob Barlow**, a medical scientist who was diagnosed with azoospermia more than 25 years ago.

ON THIS PAGE

- 1 **What is azoospermia?**
- 2 **The two main types**
- 3 **How it is diagnosed**
- 4 **Treatment options**
- 5 **You are not alone**
- 6 **Sources**

Ask the community

Men who have had this diagnosis talk about it every week on the forum.

[Ask a question](#)

In short

- ✓ Azoospermia means there is no measurable sperm in the ejaculate.
- ✓ It affects about 1% of all men and around 10–15% of men with infertility.
- ✓ There are two main types, obstructive and non-obstructive, and they are treated differently.
- ✓ Many men still have options, including sperm retrieval with ICSI or donor sperm. A urologist or andrologist can talk them through with you.

What is azoospermia?

Azoospermia means there is no measurable sperm in the ejaculate. It affects about 1% of all men and around 10–15% of men with infertility.

It is usually confirmed by at least two semen analyses, with the sample spun down (centrifuged) so the lab can look carefully for any sperm at all.

The two main types

BLOCKAGE

Obstructive

Sperm are made, but a blockage stops them reaching the ejaculate. This can happen:

- after a vasectomy
- after infection or injury
- with congenital absence of the vas deferens, which is linked to cystic fibrosis gene changes

PRODUCTION

Non-obstructive

The testes make very little or no sperm. Causes include:

- genetic conditions such as Klinefelter syndrome or Y-chromosome microdeletions
- hormone problems
- a history of undescended testes
- previous chemotherapy or radiotherapy

How it is diagnosed

Working out which type you have shapes every next step. Your doctor may arrange:

✓ **Repeat semen analysis**

To confirm the result on a second sample.

✓ **Physical examination**

Of the testes and the tubes that carry sperm.

✓ **Hormone blood tests**

FSH, LH and testosterone.

✓ **Genetic tests**

Karyotype, Y-chromosome microdeletion and CFTR.

✓ **Scrotal ultrasound**

Sometimes, to look at the testes and surrounding structures.

Treatment options

If it is obstructive

Surgical repair, such as a vasectomy reversal, or sperm retrieval (PESA, MESA or TESA) with the sperm then used in ICSI.

If it is non-obstructive

In some men, hormone treatment. Surgical sperm retrieval, such as micro-TESE, with any sperm found used in ICSI.

Donor sperm

Donor sperm is another route to parenthood, and one many couples on the forum have talked through openly.

 **Talk your options through with a specialist.** A urologist or andrologist can explain which routes fit your results.

FROM THE FORUM

You are not alone

Men with azoospermia, and their partners, talk about tests, retrieval and what comes next on the Causes of male infertility board. [n] members are discussing it.

Just diagnosed with non-obstructive azoospermia. Where do we start?

Obstructive after vasectomy: PESA or reversal?

Karyotype normal, still waiting on Y-microdeletion results

My wife and I got the results last week. Two semen analyses, both showed no sperm at all, and the consultant thinks it is probably non-obstructive. My FSH came back high.

I honestly don't know what to feel. I keep reading about micro-TESE and success rates and it is all a blur. If anyone has been through this, what should we be asking at the next appointment?

I was exactly where you are three years ago. Write your questions down before the appointment, because you will forget them in the room. Ask whether they have checked your karyotype and for Y-chromosome microdeletions, because that changed what our options were.

And look after yourself. The first month was the hardest part for me.

Azoospermia

Azoospermia means there is no measurable sperm in the ejaculate. It is a diagnosis many men have never heard of until it is theirs. This guide explains the types, the tests and the routes to parenthood.

 Written by [Author name]

 **Medically reviewed by** [Reviewer name, credentials]

 Last reviewed [date]

PR

RB

Mensfe is run by Pip Reilly, a professional fertility counsellor with over 15 years' experience with fertility charities, and Rob Barlow, a medical scientist who was diagnosed with azoospermia more than 25 years ago.

In short

- Azoospermia means no measurable sperm in the ejaculate. It affects about 1% of all men and around 10–15% of men with infertility.
- There are two main types: **obstructive** (sperm are made but blocked) and **non-obstructive** (the testes make very little or no sperm).
- Diagnosis uses repeat semen analysis, an examination, hormone and genetic blood tests, and sometimes an ultrasound scan.
- Depending on the type, options include surgical repair, sperm retrieval used with ICSI, hormone treatment in some men, or donor sperm.

1 What is azoospermia?

Azoospermia is the medical term for having no measurable sperm in the ejaculate. It affects about 1% of all men, and around 10–15% of men with infertility.

It is usually confirmed by at least two semen analyses. The laboratory spins the sample down (centrifuges it) to look closely for any sperm at all before the result is called azoospermia.

Key facts	
What it means	No measurable sperm in the ejaculate
How common	About 1% of all men; around 10–15% of men with infertility
How it is confirmed	At least two semen analyses, with the sample centrifuged
Main types	Obstructive and non-obstructive
Who to talk to	A urologist or andrologist

2 The two main types

Knowing which type you have matters, because it shapes which treatment options are open to you.

Type 1

Obstructive azoospermia

Sperm are being made, but a blockage stops them reaching the ejaculate.

CAUSES INCLUDE

- A previous vasectomy
- Infection or injury
- Congenital absence of the vas deferens, which is linked to cystic fibrosis gene changes

Type 2

Non-obstructive azoospermia

The testes make very little or no sperm.

CAUSES INCLUDE

- Genetic conditions such as Klinefelter syndrome or Y-chromosome microdeletions
- Hormone problems
- A history of undescended testes
- Previous chemotherapy or radiotherapy

3 How it is diagnosed

Your doctor will usually build up a picture from several tests. You may hear these terms at the clinic:

Repeat semen analysis

To confirm that no sperm are present, including in the centrifuged sample.

Physical examination

A check by a doctor, often a urologist or andrologist.

Hormone blood tests

FSH, LH and testosterone.

Genetic tests

Karyotype, Y-chromosome microdeletion and CFTR (cystic fibrosis gene) testing.

Scrotal ultrasound

Sometimes used to look at the testes and surrounding structures.

4 Treatment options

The options depend on the type of azoospermia and its cause.

Options by type	
TYPE	OPTIONS
Obstructive	Surgical repair, such as vasectomy reversal; or sperm retrieval (PESA, MESA, TESA) used with ICSI
Non-obstructive	In some men, hormone treatment; surgical sperm retrieval such as micro-TESE, used with ICSI
Either type	Donor sperm is another route to parenthood

Talk your options through with a urologist or andrologist. They can explain what your own test results mean for you.

06Ask the community

In short

- ✓Azoospermia means no measurable sperm in the ejaculate. It is usually confirmed by at least two semen analyses.
- ✓It affects about 1% of all men and around 10–15% of men with infertility.
- ✓There are two main types: obstructive (sperm are made but blocked) and non-obstructive (the testes make very little or no sperm).
- ✓Depending on the cause, options include surgical repair, sperm retrieval used with ICSI, hormone treatment for some men, or donor sperm.

What is azoospermia?

Azoospermia is the medical term for having no measurable sperm in the ejaculate. Many men only find out when they have a semen analysis as part of fertility tests.

1%of all men are affected by azoospermia.
That rises to around 10–15% of men with infertility.

A single result is not enough for a diagnosis. Azoospermia is usually confirmed by at least two semen analyses, with the sample spun down (centrifuged) so the laboratory can look carefully for any sperm at all.

The two main types

Doctors divide azoospermia into two groups, because the cause shapes which treatments make sense.

OBSTRUCTIVE

Sperm are made, but blocked

The testes produce sperm, but a blockage stops them reaching the ejaculate.

Causes include a previous vasectomy, infection or injury, or congenital absence of the vas deferens, which is linked to cystic fibrosis gene changes.

NON-OBSTRUCTIVE

Very little or no sperm made

The testes make very little or no sperm.

Causes include genetic conditions such as Klinefelter syndrome or Y-chromosome microdeletions, hormone problems, a history of undescended testes, or previous chemotherapy or radiotherapy.

“

Write your questions down before the appointment, because you will forget them in the room.

mark_t, on the [Causes of male infertility board](#)

How it is diagnosed

Working out the type and cause usually involves several steps. Your doctor may suggest some or all of these:

Repeat semen analysis
At least two samples, centrifuged and examined.

Physical examination
Including the testes and the vas deferens.

Hormone blood tests
FSH, LH and testosterone.

Genetic tests
Karyotype, Y-chromosome microdeletion and CFTR.

Scrotal ultrasound
Sometimes, to look at the testes and surrounding structures.

Questions you might take to your appointment

- Do you think my azoospermia is obstructive or non-obstructive, and why?
- Which hormone tests have been done, and what did they show?
- Have I had a karyotype, Y-chromosome microdeletion and CFTR test?
- Would a scrotal ultrasound help in my case?

Treatment options

The right option depends on the type and cause. These are the main routes you are likely to hear about.

OBSTRUCTIVE

Repair or retrieve

Surgical repair of the blockage, such as vasectomy reversal.

Or sperm retrieval (PESA, MESA or TESA), with the sperm used in ICSI.

NON-OBSTRUCTIVE

Hormones or micro-TESE

In some men, hormone treatment.

Surgical sperm retrieval such as micro-TESE, with any sperm found used in ICSI.

Donor sperm is another route to parenthood, and some couples consider it alongside or after other options.

Every situation is different. Talk your options through with a urologist or andrologist, who can explain what is realistic for you.
